

Table Leg Shims

To level a table you shim under the legs

Shim material needs to be non-compressable

Shim material may need to be up to 2 inches thick

Note / A playing card thickness may be enough to throw a ball roll

Shims are made out of a large number of non-compressable materials

The shims selected should be sized and shaped for the leg

On a 1/4" to the foot garage floor slope, about 2" of shim material is needed

Old time installers often used playing cards for shims, they still work

It is very important that your table be absolutely level.
